Introduction

The deployment phase involved transferring the FINDIT Lost and Found Management System from a local development environment to a live production environment accessible through the internet. This process included database migration, application configuration, file deployment, routing verification, and live functionality testing.

The objective of deployment was to ensure that the system could operate reliably in a real-world environment while maintaining its functionality, security, and accessibility.

Development Environment

Prior to deployment, the system was developed and tested locally using the following technologies:

- CodeIgniter 4 Framework
- PHP
- MySQL Database
- XAMPP Local Server
- Visual Studio Code
- Git and GitHub

Local testing included user registration, login, item reporting, item browsing, claim submission, item update reporting, and administrator functions.

Hosting Environment

The application was deployed using InfinityFree Hosting.

A hosting account was created and assigned the following public domain:

Live URL:

<https://finditlostandfound.infinityfreeapp.com>

The hosting environment provides web server services, database management, and public internet accessibility for the application.

Deployment Procedure

The deployment process was completed through the following steps:

1. Database Export

The local MySQL database was exported using phpMyAdmin.

2. Production Database Creation

A new MySQL database was created through the InfinityFree hosting control panel.

3. Database Import

National Teachers College

College Department
629 Nepomuceno, Quiapo, Manila

The exported SQL database file was imported into the production database using phpMyAdmin.

4. File Upload

Application source files were uploaded to the hosting server through the InfinityFree File Manager.

5. Environment Configuration

Production configuration settings were updated, including:

- Application Base URL
- Database Credentials
- Environment Settings
- Routing Configuration

6. Verification

After deployment, all major modules were tested to ensure proper functionality in the live environment.

Issues Encountered During Deployment

Issue 1: Homepage Access Error

Upon initial deployment, the application homepage returned an error because no default route was configured.

National Teachers College

College Department
629 Nepomuceno, Quiapo, Manila

Solution:

A default route was added to redirect users to the login page.

Result:

The application homepage became accessible through the live domain.

Issue 2: Localhost References

Some configuration settings continued to reference localhost values from the development environment.

Solution:

Configuration files were updated with the correct production URL.

Result:

The application became accessible through the deployed domain.

Issue 3: Environment Configuration Errors

Certain deployment configurations differed from the local development environment.

Solution:

Environment settings were reviewed and corrected to match production requirements.

National Teachers College

College Department
629 Nepomuceno, Quiapo, Manila

Result:

Application functionality was restored and verified successfully.

Post-Deployment Testing

After deployment, the following features were tested:

User Functions

- User Registration
- User Login
- User Logout
- Item Reporting
- Browse Items
- View Item Details
- Submit Claim Requests
- Submit Item Update Reports

Administrative Functions

- Dashboard Access
- Item Monitoring
- Item Status Management
- Claim Review

National Teachers College

College Department
629 Nepomuceno, Quiapo, Manila

- Claim Approval
- Claim Rejection
- Item Update Review

All tested functions operated successfully within the production environment.

Deployment Outcome

The deployment of the FINDIT Lost and Found Management System was completed successfully.

The application is currently accessible online through the assigned InfinityFree domain and all major functionalities operate as expected.

Deployment Status: Successful

System Status: Operational

Live URL: <https://finditlostandfound.infinityfreeapp.com>

Conclusion

The deployment process successfully transitioned the FINDIT Lost and Found Management System from a local development environment to a live production environment. Database migration, application configuration, routing verification, and functionality testing were completed successfully.

National Teachers College

College Department
629 Nepomuceno, Quiapo, Manila

The deployed application is now publicly accessible and capable of supporting the intended lost-and-found management operations.
